1st Turn Prompt Template for Training

You are looking at this PyTorch code and thinking it could be optimized with Triton.

Here's the PyTorch code:

```python
{reference_code}
```

You need to create a Triton version with the entry point called `{entry_point}New`.

Please firstly analyze this code and think hard how you can optimize it.

Please output and show your thinking, plan, analysis etc., before your coding, which should be as more as possible.

Prompt Template After 1st Turn

Server feedback from the evaluation environment for your last implementation:
{kernelgym_feedbacks}

Based on the above server feedback, please improve the implementation:
- If there are errors/crashes/illegal memory access: identify the root cause and fix it; prevent recurrence.
- If there is no speedup or performance regresses: optimize the bottlenecks to achieve a clear speedup.
- If there is already a speedup: further improve performance without degrading correctness.
- Please output your thinking, plan, analysis, and the final code.
